B. Total Pounds of Battery Lead Available for Recycling

III. Recycling Rate Worksheet 6

A. BCI Recycling Rate 2017 – 2021

B. Footnotes

I. Introduction

The National Recycling Rate Study, commissioned by Battery Council International (BCI), is designed to calculate the recycling rate of lead available from lead batteries in the United States.[1] The first study was conducted in 1990. This most recent study completed finds the recycling rate for the years 2017-2021 to be 101.0%[2] with a standard deviation of ±0.3%.[2]

Because the years covered by this report experienced significant societal and market fluctuation during the COVID 19 pandemic, BCI has also calculated a 10-year trailing average for the recycling rate, utilizing data from the current and past National Recycling Rate Studies. The 10-year trailing average for the decade ending in 2021 is 99.8%.

Part II of this report includes a review of the methodology used to determine the domestic recycling rate for battery lead during the years 2017-2021. Part III contains the data from which the recycling rate was calculated along with footnotes listing sources from which the data was obtained.

II. Methodology

The National Recycling Rate Study is conducted by Vault Consulting, LLC., Chicago, Illinois. The national recycling rate® was calculated by dividing the total pounds of battery lead recycled (LR) by the total pounds of battery lead available for recycling (LA) in the United States. The calculation is as follows:

$R = (LR/LA) \times 100.$

A. Total Pounds of Lead Recycled from Batteries

To determine the total pounds of lead recycled from batteries, questionnaires were sent to all U.S. secondary lead recyclers. The data gathered from the questionnaires indicates the total pounds of lead recycled from batteries at U.S. recyclers. This total includes lead from whole batteries and lead from battery scrap.

All starting, lighting and ignition (SLI), industrial batteries (motive power and stationary), and small sealed lead batteries are included in this analysis. However, since the secondary lead recyclers record the receipt of batteries by weight rather than by type, it is impossible to determine the recycling rate for each category of battery.[3]

B. Total Pounds of Battery Lead Available for Recycling

When calculating the total pounds of lead available for recycling, the following data was included in the equation:

1. New battery shipments (including new battery imports shipped).
2. New battery exports.
3. Imports and exports of vehicles/products containing a battery.
4. Imports and exports of scrap lead and used batteries.

1/ BCI is a not-for-profit trade association whose members are engaged in the production of lead storage batteries for automotive, marine, industrial, stationary, specialty, commercial and consumer uses. BCI's members also include entities engaged in the reclamation or recycling of used lead batteries.

2/ Copies of previous National Recycling Rate Study reports can be obtained from BCI, 330 North Wabash Avenue, Chicago, Illinois 60611, email: info@batterycouncil.org

3/ When a recycler receives a truckload of batteries, it weighs the truck with and without the batteries to determine the net weight of the shipment. After determining the types of batteries received, the recycler multiplies the weight of the shipment by a pre-determined factor to identify the amount of battery lead received for recycling. These pre-determined factors are adjusted annually.

1. Battery Shipments

New battery shipment data, including domestic and export, for SLI batteries was obtained from BCI's statistical database.[4] Imported batteries that are shipped to U.S. destinations are reported to BCI and classified as a shipment. Since the SLI shipment data is in units, an average lead weight was applied to each battery category to determine the total pounds of lead available for recycling from that category.

To determine the amount of lead available for recycling from industrial batteries, BCI surveys industrial battery manufacturers on the amount of lead used in the production of motive power batteries and stationary batteries shipped during the relevant years.

In addition, average battery life must be taken into account when identifying the number of batteries available for recycling. For the purpose of this study, a battery becomes available at the expiration of its average operating life. The batteries included in the analysis, and their average operating lives, are:

AVERAGE OPERATING LIFE BY BATTERY TYPE

	Number of Years		Number of Years
Passenger Car & Light Truck	4	Aircraft	2
Truck & Heavy Duty Truck	3	Military	6
Tractor	3	Miscellaneous & Others[5]	3
Marine & RV	3	Motive Power	6
General Utility (Wheelchairs, Small Lifts, Autonomous Vaccums, etc.)	2	Stationary	10
Golf Car & Floor Scrubber	3	Small Sealed Lead (SSL)	5
Motorcycle	2		

2. Battery Imports and Exports

As mentioned earlier, imported SLI batteries that are shipped to U.S. destinations are classified as a shipment and reported to BCI monthly. However, small sealed lead (SSL) battery shipments are not reported to BCI. Since virtually all SSL batteries are imported, those numbers are obtained, along with other data on imports and exports of new batteries, from the U.S. Department of Commerce.

3. Vehicle/Product Imports and Exports

Data was collected on the imports and exports of vehicles known to contain batteries when shipped into or out of the United States. The imports and exports of passenger cars, trucks, buses, motorcycles were obtained from the U.S. Department of Commerce.

Based on consultation with industry experts, it is estimated that in addition to the total number of SSL batteries imported into the United States, and reported in Department of Commerce data, an additional 34% of that volume of SSLs comes into the United States within products. It is also estimated that about 2% of the imported SSL batteries are placed into products and exported back out of the United States. Those product imports and exports have been included in the equation. All data was adjusted for each battery category's average life and assigned an average lead weight.

4. Scrap Lead and Used Battery Imports and Exports

Imports and exports of scrap lead and used batteries were obtained from the U.S. Department of Commerce.

4/ BCI collects data regarding shipments of SLI and industrial batteries on a monthly basis from its members. BCI's database includes SLI battery shipment figures back to 1937.

5/ Including specialty batteries which are used in such applications as trolley cars, etc.

Scrap Lead:

Scrap export code 7802.00.0030 is now multiplied by 70% to account for the percentage that is plastics. This change is important because it recognizes the role that plastics play in the automotive industry and ensures that the data is reflective of this.

Scrap exports are now divided by Wood Mackenzie projection factor (roughly .59) to account for underreporting. This change recognizes that there may be some underreporting in the data and takes steps to ensure that the information provided is as accurate as possible.

Scrap exports denominated in "units" instead of kilograms are now converted to pounds by multiplying by the average battery weight implied from automotive data. This change ensures that there is consistency in the units used and allows for easier comparison of data across different sources.

Used Batteries:

For the purpose of this analysis, the number of used batteries was multiplied by the average lead weight of a passenger car or light commercial battery[6] during the years the batteries were assumed to be produced.

5. Notes

Average Lead Weight for Automotive Batteries

Major battery manufacturers are surveyed annually to identify the weight of lead contained in the various automotive battery categories produced each year. This data is used to estimate the total pounds of battery lead available for recycling during each year of the study.

Average Battery Life and Recycling Rate

As mentioned earlier, average battery life is taken into account when identifying the number of batteries available for recycling in a given year. However, these averages are estimates and some batteries may not enter the recycling stream during the estimated year (i.e., some after, some before). Thus, aggregating the data over a five-year period provides a more accurate picture of battery recycling activity in the U.S.

6/ The average lead weight for a passenger car and light commercial battery was calculated at 24.6 pounds for the 2017 – 2021 recycling rate.

III. Recycling Rate Worksheet

The following pages contain the worksheet from which the recycling rate for the years 2017 – 2021 was calculated and footnotes listing sources from which relevant data were obtained.

A. BCI Recycling Rate: 2017 – 2021
